N questions

Two years with Turing.jl v0

Overview

Turing provides a macro-based DSL to express probabilistic models

3 good things

```
@model function eight_schools(y, sigma)
    mu ~ Normal(0, 5)
    tau ~ truncated(Cauchy(0, 5); lower=0)
    theta ~ MvNormal(fill(mu, length(y)), tau^2 * I)
    for i in eachindex(y)
        y[i] ~ Normal(theta[i], sigma[i])
    end
end
```

2 things to improve

Turing provides a macro-based DSL to express probabilistic models

3 good things

and (mostly Bayesian) inference algorithms

2 things to improve

```
@model function eight_schools(y, sigma) ... end
```

```
y = [28, 8, -3, 7, -1, 1, 18, 12]  
sigma = [15, 10, 16, 11, 9, 11, 10, 18]
```

N questions

```
model = eight_schools(y, sigma)  
sample(model, NUTS(), 1000)
```

Two years with Turing.jl v0

Overview

Turing provides a macro-based DSL to express probabilistic models

3 good things

and (mostly Bayesian) inference algorithms

2 things to improve

I & others worked on it July 2024 – May 2026

N questions

penelope 25 Jun at 5:06 PM

the use of filldist, which does not give pointwise loglikelihoods.

you might be able to pass `factorize=true` to loo to make it do so: <https://pysm.dev/FlexiChains.jl/stable/integrations/#PosteriorStats.loo-Tuple{DynamicPPL.Model,%20FlexiChains.FlexiChain}>

since when does this work when the LHS is an Array?

Since forever, basically. I don't like it myself github.com/TuringLang/DynamicPPL.jl/issues/919
It only "works" for observations, and not random parameters. (edited)

Two years with Turing.jl v0

Overview

3 good things

2 things to improve

N questions

(1) Modularity

State type used for model evaluation:

```
struct VarInfo{V<:Dict,L<:Real}  
    values::V  
    logp::L  
    # other fields ...  
end
```

N questions

(1) Modularity

New accumulators represent outputs

```
struct VarInfo{A<:Tuple{Vararg{Accumulator}}}  
    accs::A  
end  
  
struct LogLikeAcc{L<:Real} <: Accumulator  
    loglike::L  
end  
  
struct LogPriorAcc{L<:Real} <: Accumulator  
    logprior::L  
end
```

Two years with Turing.jl v0

Overview

3 good things

2 things to improve

N questions

(1) Modularity

New accumulators represent outputs

New “initialisation strategies” represent inputs

Init strategy → **Model** → Accumulators

Custom subtypes make this *very* flexible!

Overview

3 good things

2 things to improve

N questions

(2) Performance

Drastic reduction in Turing's overheads (>1000x in some cases)

Two years with Turing.jl v0

Overview

3 good things

2 things to improve

N questions

(2) Performance

Drastic reduction in Turing's overheads (>1000x in some cases)

Mostly comes from judicious use of accumulators, but also new data structures (`VarNamedTuple`)

Two years with Turing.jl v0
